

Where AI belongs.

The operating system for AI agents. One install gives any AI a memory that never forgets, 450+ tools to act, and a safe way to get real work done.

Cursor

Windsurf

unclick.world • Transparent. Trusted. Traceable.

AI is a genius. On its own, it is a genius **locked in an empty room.**

It can think brilliantly, but it forgets you the moment you close the chat, and it cannot touch any of your real tools.

UnClick gives any AI a **memory that never forgets** and **hands that actually do the work** - while your data stays yours.

Today's AI has three problems.

Amnesia

Close the chat and it forgets everything. Your preferences, your projects, last week's decisions, gone. You re-explain yourself every single time.

No hands

It can write the email but not send it. Plan the trip but not book it. Suggest the code but not ship it. You are still the one clicking.

Locked in a box

It only knows what is in the chat window. It cannot see your calendar, your files, or your tools. Brilliant, but cut off from your real life.

Everyone just got a genius. Nobody connected it to their life.

In two years, AI assistants went from novelty to everywhere. Claude, ChatGPT, Copilot, Cursor, Windsurf. But each one is its own island: separate memory, separate login, no shared brain, no hands.

🧠 brains added ✓

🔌 the wiring is missing

← that is the opportunity

• WHAT UNCLICK IS

One layer that sits behind **every AI.**

Picture a brilliant new hire on day one. UnClick is everything they need to be useful: a filing cabinet, a toolbox, the keys, and a foreman who checks the work.

One install

No code

Any device

Memory

A shared brain.
Remembers across every chat, tool, and device.

Apps

450+ tools. Email, calendar, money, code, and more.

Your data island
stays yours

Connections

Sign in once. Your AI safely uses everything else.

Autopilot

Plans, builds, checks, and proves real work, with safety gates.

Three steps. No code.

1

Connect once

Sign in to the accounts you choose. It takes minutes, and you decide what is shared.

2

Your AI levels up

It instantly gains memory and 450+ tools. Nothing to install for each app.

3

Just ask

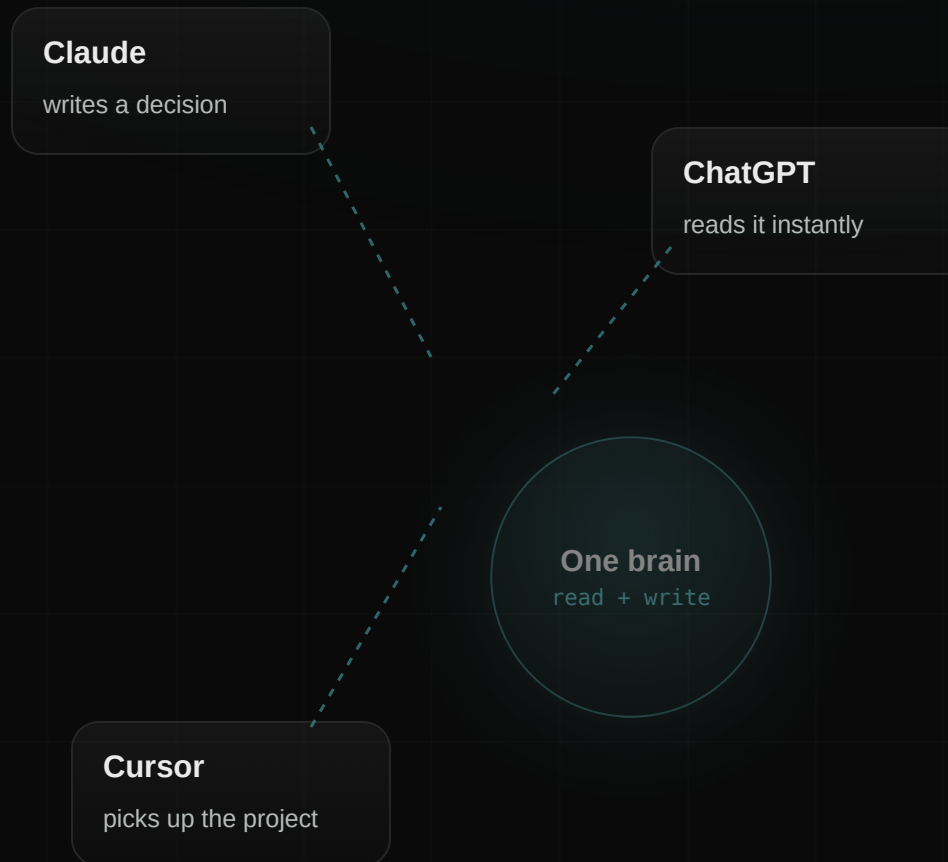

Talk normally. It remembers, acts, and proves it, on any AI and any device.

Like giving a new employee the keys to the office, a phone, and a filing cabinet.

Tell it once. It remembers forever, everywhere.

Normal AI forgets between chats. UnClick is the notebook that carries over: your preferences, decisions, and projects. And it is shared, so what you tell Claude in the morning, ChatGPT knows in the afternoon.

The point: native AI memory is volatile. UnClick is the one place your context actually lives.

Every tool your agent needs, in one install.

450+

callable endpoints

178+

tools

20+

secure connections

∞

new tools every week, auto-picked up

Email and messaging

Calendar and tasks

Money and payments

Developer tools

Social and media

Shopping and travel

Security and data

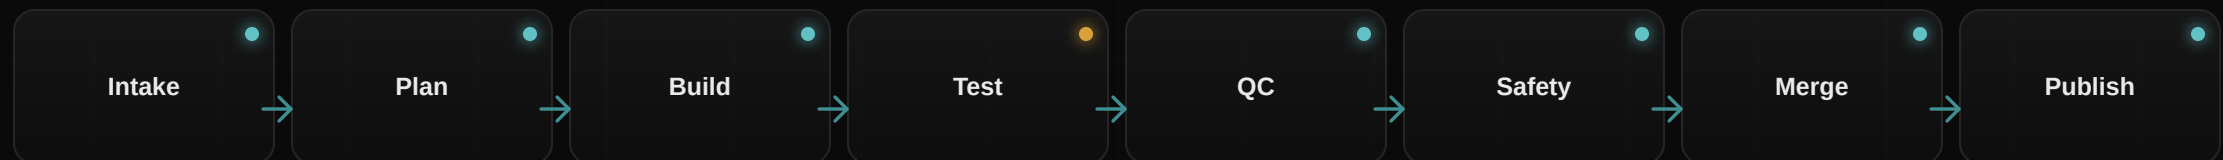

Knowledge and web

MCP is the universal adapter - like USB-C for AI. It lets any tool plug into any AI, so one install covers everything.

Like a translator, not a spy. Tools pass information between you and the services you already use. They do not store or sell it.

A factory floor for AI work, with a big red stop button.

For bigger jobs, Autopilot runs work down an assembly line. Every stage checks the one before it. Nothing ships until it passes.

LAUNCHPAD

Your control desk. Pause or stop anything, at any moment.

BOARDROOM

Where the AI workers coordinate, out in the open.

THE PROMISE

Autonomy with observability. You stay in command.

Transparent. Trusted. Traceable.

Your data stays yours

Processed in real time, not stored or sold.
Connections are encrypted. You choose exactly what is shared.

Every action is logged

An audit trail records who asked, who approved, the exact scope, the proof, and how it can be stopped.

You hold the kill switch

High-impact actions need permission. If anything drifts, one switch stops it immediately.

Five questions, always answerable: who requested it · who approved it · what scope · what proof · how to stop it

We do not compete with ChatGPT or Claude. We make all of them better.

AI ON ITS OWN	AI + UNCLICK
✗ Forgets between sessions	✓ Remembers forever
✗ Memory trapped in one vendor	✓ One brain across all AIs
✗ Cannot touch your tools	✓ 450+ tools to act
✗ No safety trail	✓ Full audit + kill switch
✗ Re-setup everywhere	✓ Set up once, works everywhere

The moat gets deeper over time

- ↑ **Memory gravity.** The more it remembers, the more it would cost to leave.
- 🔗 **Connection gravity.** Sign in once. All your accounts live here.
- 🔲 **Tool network.** 450+ and growing weekly, picked up automatically.
- 👉 **Model-agnostic.** Whichever AI wins the race, UnClick wins with it.

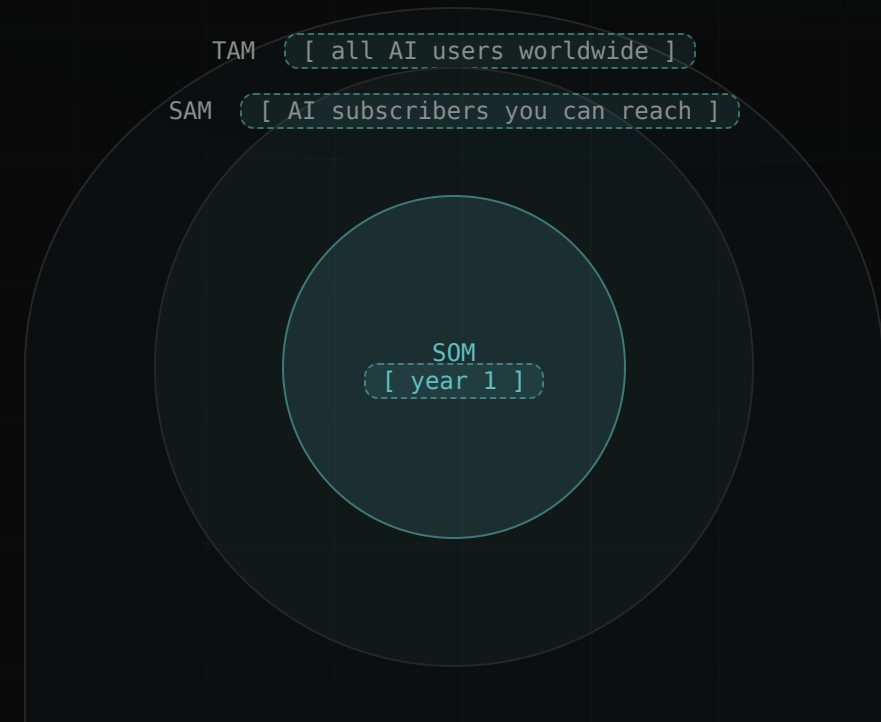

The more you connect, the more it does. That is the moat.

- THE OPPORTUNITY

Every AI needs a memory and hands.

Every knowledge worker is getting an AI assistant. Every one of them is amnesiac and tool-less out of the box. UnClick is the layer that fixes that, for individuals first, then teams, then enterprises.

Live at unclick.world. Built by an AI fleet that runs on UnClick itself.

From personal assistant to the standard layer for all AI.

NOW

Memory and 450+ tools, live across every major AI client. One install, any device.

NEXT

Teams and Crews. Deeper Autopilot autonomy. More connectors, every week.

LATER

Enterprise-grade compliance and audit. The default memory and tool layer for AI.

Builders who dogfood their own product.

UnClick is built using UnClick. The same Autopilot, memory, and safety gates we offer are what we ship with every day. That is the strongest proof the system works.

FOUNDER

Where AI belongs. Humans welcome.

AI you can trust, that remembers you, and actually gets things done.

Let's talk

[your email]

unclick.world

No jargon required.

UnClick the whole platform. Memory, tools, and safe autonomy for any AI.

Apps the 450+ tools your AI can use to actually do things.

Autopilot the assembly line that plans, builds, checks, and proves work.

Boardroom where the AI workers coordinate in the open.

Memory the shared notebook your AI never forgets, across every device.

Connections sign in once, your AI safely uses the rest.

Launchpad the control desk, with the kill switch.

MCP the universal adapter for AI tools. USB-C for AI.
