

The universal remote for AI.

One install gives any AI a toolbox of 900+ real-world actions and a memory that never forgets.

AI is brilliant. On its own, it is trapped in the chat box.

UnClick is the layer that sets it free. One install plugs any AI agent into the real world, gives it a memory, and lets a whole team of agents work together.

01

Tools

Act across 900+ real actions

02

Memory

Remember across sessions

03

Connections

Sign in once, use forever

04

Autopilot

Run a whole team of agents

05

XPass

Prove the work is right

Every app is racing to add an AI agent. None can remember or act on their own.

THE WAVE

Agents are everywhere

Claude, ChatGPT, Cursor and dozens more are now in daily use by millions of people and businesses.

THE STANDARD

They all speak MCP

A new shared plug for AI, like USB-C for hardware. Connect once, and any tool just works.

THE OPENING

No one owns the hub

There is a universal port now, but no fully stocked hub behind it. That is the layer we build.

PICTURE IT

It is the early internet, before the operating system showed up. Lots of brilliant browsers, but no shared layer to remember anything or get real work done.

Your AI forgets everything the moment you close the chat.

Teach it your preferences today, and tomorrow it is a stranger again. Switch from Claude to ChatGPT and it all resets to zero. Every session starts with a catch-up tax that humans would never agree to pay twice.

IMAGINE

*A brilliant assistant with amnesia every midnight.
You re-explain your whole life, every single
morning, forever.*

And it cannot actually touch the tools you use.

Want it to send the email, charge the customer, or update your store? Today a developer hand-wires each service, one at a time, and does it again for the next agent.

PUT SIMPLY

*An AI with no tools is a smartphone with no apps.
It can think brilliantly, but it cannot do anything.
As UnClick puts it: like doing surgery with oven mitts.*

— THE THESIS

Agents are powerful, but homeless.

UnClick gives them a home: a memory, a toolbox, an identity, and a team.

— THE SOLUTION

One install gives any AI a memory and 900+ hands.

Add one line to your AI app. Instantly it remembers you forever and can act across 218 services, with no custom wiring, ever.

THE BIG IDEA

This is the operating-system moment for AI agents. The app-store moment. The brain stays the same; suddenly it can actually do things.

— HOW IT WORKS

One universal port. The world's most stocked hub.

AI just adopted a standard plug called MCP, think USB-C for AI. UnClick is the most fully stocked hub you can plug into: 900+ tools behind a single connector.

Works with Claude, ChatGPT, Cursor, and anything that speaks MCP. New tools appear automatically on the server side, so your agent gets more capable over time with no updates to install.

Going live takes three clicks, not three days.

STEP 1

Enter your email

Get your private UnClick link.

STEP 2

Pick your AI

Claude, ChatGPT, Cursor, and more.

STEP 3

Paste one URL

Drop it into the connect dialog. Done.

No JSON, no terminal, no setup. The AI you already use simply gains a memory and 900+ tools.

IT FEELS LIKE

Adding a contact, not installing software.

Every tool your agent needs, in one install.

218 **914** **20**

INTEGRATIONS

CALLABLE TOOLS

CATEGORIES

From Stripe and Shopify to Gmail, GitHub, Spotify, crypto prices, weather, and your smart-home lights.

Whatever the job, there is a tool for it.

Live count from the UnClick catalog: 914 tools across 20 categories. Showing the 14 largest.

Not just many tools. Tools that are actually reliable.

L1

It works

A clean, callable action.

L2

It is reliable

Timeouts, graceful errors, rate-limit handling, and a test. The hardening bar.

L3

It remembers you

Fills in the blanks from your memory (your home stop, your default store).

L4

It taps you on the shoulder

Pushes a signal when something changes, instead of only answering when asked.

L5

It shows its work

Stamps every answer with the source, how fresh it is, and the suggested next step.

154

TOOLS AT THE TOP L5 TIER

189

HARDENED TO THE RELIABILITY BAR

1

STANDARD ACROSS ALL OF THEM

A memory that survives every session, model, and device.

WHO YOU ARE

Identity

Standing rules loaded every time.

WHAT YOU DECIDED

Facts

Preferences, fixes, decisions.

LAST TIME

Sessions

Pick up exactly where you left off.

REFERENCE

Library

Your canonical documents.

THE RECORD

Conversations

The full transcript, replayable.

YOUR SYSTEMS

Code

Snapshots of how things work.

THE DIFFERENCE

*Others keep your memories in their cloud.
UnClick keeps them in yours, encrypted, and you
can take them with you any time.*

Sign in once. Your AI uses everything else.

One secure keychain. Connect a service a single time, and your agent can use it from then on, without ever seeing your raw passwords.

THINK OF IT AS

Giving a trusted assistant a building pass, not a copy of every key in your life.

When one AI is not enough, UnClick runs a whole team.

THE BOSS

Orchestrator

Your own chat gives the orders. The AI you already use stays in charge.

THE WORK QUEUE

Job Board

Tasks get posted and handed to the right worker (Claude Code, Codex, Cursor). Nothing ships without a receipt.

THE TEAM ROOM

Boardroom

Agents claim jobs, hand off, check in, and post proof, so nobody does the same work twice.

PICTURE A CONSTRUCTION SITE

An architect, a foreman, and ten specialists, with a site manager making sure nobody builds the same wall twice.

It can wake itself up, even when you are asleep.

Agents can trigger on events and schedules, do the work, then report back what worked, what failed, and what needs you.

A RULE WE BUILD ON

Autonomy without observability is a blocker, not a feature. Every action is logged, owned, and reversible, like a smart home that warms the house before you wake.

Proof the work was done right, before it ships.

A roadworthy checklist for AI work: tests, user journeys, security, wording, and common-sense sanity checks. Each run returns one combined receipt.

WHY IT MATTERS

Trust is the wedge into businesses. AI output you can actually verify, not just a confident "trust me".

We are not another AI brain. We are the rails every brain plugs into.

Think Stripe for AI agents: the model-agnostic layer that sits behind Claude, ChatGPT, and Cursor and makes all of them more capable.

ADVANTAGE 1

The whole stack, one install

Memory, 914 tools, identity, proof, and a fleet, all to one hardened standard. Rebuilding it is years of work.

ADVANTAGE 2

Memory that compounds

The longer you use it, the more it knows you. Switching away gets harder, yet the data lives in your database. Trust, not lock-in.

ADVANTAGE 3

Proof and a learning loop

Verifiable AI work, plus a fleet that learns what actually works. The green field that raw tool count cannot copy.

And we ride the rising MCP standard. Switching cost to start is zero; the AI you already trust simply gains superpowers.

— WHY WE WIN

ChatGPT or Claude alone is a genius locked in a room.

A CHATBOT ON ITS OWN

- × Forgets you when the chat closes
- × Cannot act in your real apps
- × Works alone, no teammates
- × "Trust me" answers, no proof

THE SAME AI, WITH UNCLICK

- ✓ Remembers you forever, on any model
- ✓ 914 real actions across 218 services
- ✓ A coordinated team of agents
- ✓ A proof receipt on every job

We do not compete with Claude, ChatGPT, or OpenAI. We make all of them better, and we work with whichever one wins.

Every company is about to run on AI agents. Agents run on infrastructure.

Tens of millions of developers are building with AI today, and every agent they ship needs the same things: memory, tools, identity, and proof.

OUR PLACE IN IT

We sell the picks and shovels for the agent gold rush. Whoever wins the model, they all still need the rails underneath.

— BUSINESS MODEL

Simple subscriptions. We never mark up your AI.

FREE

\$0

Hundreds of tools, self-hosted memory. The front door.

PRO

\$29/mo

Unlimited calls, managed memory, nightly extraction.

TEAM

\$79/mo

Shared memory, multiple seats, role-based access.

ENTERPRISE

Custom

SSO, on-prem, and compliance controls.

You bring your own AI subscription, so we are never reselling tokens. Coming next: a tools marketplace where outside developers earn 80% of what their tools make.

This is not a slide-deck idea. It is already running.

✓ **Live and installable today**

Remote MCP endpoint in production. Three-click install into Claude, ChatGPT and Cursor.

✓ **The full stack is shipped**

Memory, 914 tools, the keychain, Crews, Build Desk and Signals are live, not slideware.

✓ **Built by its own product**

1,000+ pull requests, shipped by a human-plus-AI fleet running on UnClick itself.

✓ **Quality is enforced, not hoped**

Every change must pass UnClick's own proof receipt before it can merge.

To add when ready: business metrics such as installs, active agents, calls per day, and paying customers.

— TEAM

A founder plus an AI fleet, building the thing they needed.

Chris Byrne leads UnClick from Melbourne, Australia, with a designer's non-coder-first bar: if a normal person cannot understand it, it does not ship. The product is built by a human-plus-AI fleet that runs on UnClick itself, so the company is its own first proof.

To personalise: photo, one-line bio, and any advisors or early hires.

— THE VISION

Let your AI stop pretending to be human.

UnClick is the memory, the hands, and the team behind every AI agent, on every model, for everyone.

The ask: we are raising \$_____ to reach _____ over the next ____ months.
